Goods Inbound with RFID

With RFID technology and flexible solution modules from the **detego® SUITE** you can automatically register the inbound goods from a supplier.

The elimination of manual handling in the goods inbound process simplifies and speeds up the unloading process.

Within the **detego® SUITE** you can choose between two different goods inbound modules.

Goods Inbound Registration

With the **goods inbound registration module** the content of the delivery is recorded, without visual contact and at a distance of up to two meters.

You can monitor supplies at item level without additional expenses. Accurate item-level data is available directly in your system by automatically capturing all individual items.

Goods Inbound Verification

In addition, you can automatically check the entire shipment for completeness with the **goods inbound verification module**.

The registered item data is compared with the corresponding shipping notice. The module is especially user-friendly through an automatic recognition of the delivery unit. If a delivery contains wrong items or if some articles are missing, it can be detected easily with the module.

Benefits

- ▶ Very simple recording of goods in the closed package
- ▶ Significant acceleration of the product collection at item level
- ▶ Automatic comparison with the shipment notice - a manual recount is not necessary anymore
- ▶ Ensuring of an accurate supply

Hardware independent

The goods inbound modules of the **detego® SUITE** are hardware independent. The process can be realized with stationary antennas as well as with mobile readers.
