Inventory with RFID

With RFID (Radio Frequency Identification) labels, hand-held readers and the flexible **detego® SUITE** modules you can carry out stock takes quickly and easily. All items are registered without optical contact and within a reading range of over one meter. Therefore stock taking is simplified and accelerated.

Inventories can be performed at any time on a regular basis in order to guarantee the accuracy of your stocks.

The **detego® SUITE** offers two different modules for your inventory.

Inventory Registration

With the **inventory registration module** and an RFID handheld reader you can conveniently register your stocks. There will be an audible signal for each scanned item.

As soon as there is no signal, the user knows that all items have been scanned. Subsequently, there will be the correct entry to the location in your inventory management.

Inventory Verification

With the **inventory verification module** you can compare the registered inventory with the current system data.

There are various filter criteria. You will immediately receive an overview of existing, missing and any unexpected items.

Benefits

- ▶ Dramatic reduction of manual handling in the counting process
- ▶ Inventories can be performed without additional effort on a regular basis
- ▶ Avoid 'out of stocks' situations
- ▶ Increase in the actual product availability through effective replenishment

Efficient Inventory Management

The use of the **inventory registration** and the **inventory verification module** will provide accurate and reliable inventory information.

The correct data will subsequently reduce error rates and allow shorter response times to inventory changes. Out of stock situations can easily be avoided.
